## **A practical Self Risk Assessment methodology**

This system is a web-based Self Risk Assessment that enables you to conduct a risk assessment of your company.

The tool is used by single mid to large sized companies and by multinational companies with various locations.

The location's plant manager, facility manager, engineering manager or safety engineer uses the Self Risk Assessment to conduct an on-line risk assessment of their specified plants or locations.

The Self Risk Assessment for Fire and Business Interruption has a total of 50 questions covering the key risk factors. The evaluations of the risk factors are essential to properly analyze and address fire and safety concerns at your location.

A final report is produced and available immediately on-line upon completion of the Self Risk Assessment and is used to identify the areas of strength and the areas that need further attention.

Self Risk Assessments for liability will be available soon.

## About the SRA Tool

With some companies it may not be feasible or appropriate to have a survey of (all your locations) by a Risk Engineer. In this case the SRA can be used to get an instant risk perspective of your company's location(s) at a more efficient cost.

## Features of the SRA Tool

- A comparison of assessment data with industry benchmark data
- A relation between scoring and the importance of risk variables
- A summary of risk assessment results
- A selection of strong and weak points
- Risk improvement advice
- An overview of your location(s) and their assessment ratings
- Instant report of your self assessment immediately available for download and printing
- Automatic overviews of various Self Risk Assessments for the same corporation.

## Request the SRA Tool

If you would like to use, or experience the Self Risk Assessment Tool please contact Pim Noordeloos at +31 652686900 or [pim.noordeloos@zurich.com](mailto:pim.noordeloos@zurich.com).
